624 fishing must be obtained from the master fisherman. The request is accom-
226 panied by the ceremonial presentation of kava and is made by representatives from one or more specific clans. The master fisherman receives part of the catch, usually the two largest fish, unless these are tribute fish which must be presented to the chief. The wife or the daughter of the master fisherman leads women's communal fishing expeditions. In recent years the authority of the master fisherman has been breaking down. There is less organized fishing than there was in the past.

624 The professional title of carpenter (*matai*) is held by the headmen of
335 hereditary carpenter clans belonging to either the chief's carpenters or the *lemaki* carpenters.

The following is a tale told of the *lemaki* carpenters:

> The son of the first Lemaki in Lau accompanied Niumataiwalu, the chief of Lakemba, to Ono. One day the people of Ono decided to kill the chief. Lemaki went fishing with the throw net (*tuka*) reputed to have been introduced into Lau by Lemaki. He had a small adz with him for killing large fish. He saw the people running after the chief, so he fought his way to the chief and tried to protect him. The Ono people killed the son of Lemaki and afterward they killed Niumataiwalu. To compensate for this deed the *lemaki* carpenter group was given special privileges and a piece of land called Lekutu (Bush) near Tumbou, Lakemba.

The headman of the *lemaki* carpenter clan does not use the special chiefly vocabulary (p. 64) or the chiefly greeting (*tama*) to the chief. He may intercede (*sorovakina*) with the chief on behalf of a village or an individual, and he may eat food and drink kava in the presence of the chief.

624 Each island chief has a priest. Formerly, as mediator for the clan and its
793 ancestral forefathers and as a seer, the priest served to validate and sanctify the power of the chief. The priest was highly respected and feared. He received a large share of the first fruit offerings, which were presented to the ancestor god (*kalou vu*). The headman of a priest clan usually holds the title of *mbete*. This is largely honorary today, except on Mothe where the priest installs the chief.

624 The *mata ki Lakemba* (face toward Lakemba, envoy to Lakemba) is a
644 hereditary clan title found in every island group. He is the intermedial agent for the island group and the high chief at Lakemba. His duties are to deliver and present tribute to the high chief and to receive him or his representatives when they visit the island. In the latter capacity he is the leader of the reception and presentation ceremonies. The title descends from a man to
[428 his younger brother or to his son—except on Mothe, where it is hereditary in
184] the Nggali clan—and the bearer is chosen by the clan elders.

622 Some villages have a village chief. The chief of Nggalinggali is chosen from either Nanggara or Naivotavota clan. The present chief of Nggalinggali is from Nanggara. The title of chief of Tokalau was, until recently, held by the Matandravu subclan of the Vuanitavola clan. Tareasi Thiva was the last

MEN'S CRAFTS

House Building

DWELLING HOUSES

The principal house type is the sleeping or dwelling house (*vale ni mothe*) used by the household. Generally when a young man's marriage is arranged, a site is selected and plans are made for building a house. Occasionally the house is started or even completed before the wedding, so that the young couple may move into it on the wedding day. Usually, however, a year or more passes after the wedding before the house is finished. 342

The main problem in house building is payment for labor. The house site is clan property, for the use of which the individual pays nothing. Materials consist chiefly of wood from the bush which is free to all. But for the labor, in which the whole village assists, the house owner and his clan must pay in the form of a series of feasts for the workers, one feast for each working day. A worker suspends his own activities, normally the procuring and preparing of the evening meal. Hence housebuilding involves a reciprocal exchange of labor for food. 342 465 463

The carpenter, on the other hand, receives, besides the largest and best share of the daily feast, a gift of tapa, mats, and kava (called *kamunanga ni thakathaka*) in return for his skilled labor. These gifts may be classed as wages. After the work has been completed, these gifts are taken to the house of the carpenter by the owner and some members of his clan and are presented ceremonially to the carpenter. The kava ceremony follows, if kava is part of the offering. [335]

On islands where food is not abundant, provision for the series of feasts necessary to complete even a small house requires initiative and forethought. The resources of the whole clan are utilized. Building an ordinary dwelling house requires a year to two and is a strain on the resources of the clan. Usually the owner must solicit from relatives in other villages, thus incurring further obligations. Hence, not many new houses are built. Unless his home is destroyed by a hurricane, a man usually builds only one house during his lifetime.

While I was on Kambara four houses were under construction: two in Tokalau, one in Nggalinggali, and one in Undu. One house in Tokalau and the house in Undu had been started before I arrived and were completed before I left. When I visited Namuka and Mothe no houses were under construction. On Ongea one house and on Fulanga one house in Muanaithake and one in Naivindamu were being built. 342

Well-built houses last several decades, but the strong hardwood beams last much longer. The main supporting posts (*nduru*) made of greenheart,

Kambara

down by means of wall plates. The rounded ends, which are added to the main framework, involve much labor; but they are considered more pleasing than the straight ends of the rectangular house on Viti Levu. 342 [517]

Today a level, open place with a fresh sea breeze is sought for a house site, whereas formerly a man wanted to be near his neighbors. If possible a site is chosen in the hamlet of the man's own clan. If there are no suitable sites in his own clan-hamlet a man asks for a site in the hamlet of his mother (p. 122). 342 361

If the owner (*taukei*) is a carpenter (*matai*) he usually does the carpenter's work himself, otherwise he chooses a carpenter from his own village. He makes his request at the carpenter's house without the ceremonial presentation of property. The carpenter is in charge of the house building. Before building starts he consults the owner about every part of the house. The carpenter does the work requiring skill and experience, such as the ornamental lashings, and directs the building operations. The owner supervises the whole process. The natives say they can recognize the style of each carpenter by the proportions and curve of the roof, although carpenters have no specific trade marks. Each carpenter knows a few simple lashing designs. For especially fine lashing a specialist from another village is occasionally employed. A specialist in lashing knows a large number of designs. 342 335 [284]

Dwelling houses in Tokalau range from small houses like Mburotu (fig. 3, 3) measuring 7 meters long, 4 meters wide, and 5 meters high and built directly on the ground, to large houses like Vale Levu, the house of the chief of Kambara (fig. 3, 1) measuring 12 meters long, 6 meters wide, and 10 meters high, excluding the 1 meter high foundation mound. The largest house in the village besides the mission church is Koro Vou (fig. 3, 26), built as a guest house for visiting chiefs and officials. It is 16 meters long, 7.5 meters wide, and 6.5 meters high, excluding the 60 cm. high foundation mound. The houses in large villages like Nggalinggali on Kambara, Nawatchia on Namuka, Nasau on Mothe, Muanaithake on Fulanga, and Naithulaianga on Ongea average about the same size as the houses in Tokalau. The highest mounds are found in Nasau. In small villages of low rank, like Lomatchi on Kambara, Korotolu on Mothe, and Naivindamu on Fulanga, the houses are smaller. 342

Before the timber is felled, the owner determines the size of the house by deciding on the dimensions of the rectangular ground plan between the main supporting posts (*nduru*). Although the ground plan of the finished house is oval, the size of the house is measured by the length and width of this inner rectangular ground plan exclusive of the rounded ends and the space between the main supporting posts and the walls. The units of measurement are the fathom and the span. Measuring is done with sennit or vines and marked off with a knife, charcoal, or an imported lead pencil. [804]

231 legged, razor backed Oceanic type which could undoubtedly be improved by the infusion of new blood.

322 335 We have considered some methods by which the available food resources may be developed. Let us turn to native craftsmanship. The crafts for which southern Lau has been famous are canoe building, woodwork, and the making of barkcloth, mats, and perfumed oil. All these crafts are very much alive in Lau today, but an increase in the quantity and to some extent also the quality of production would not only add zest to the economic life but would greatly benefit the individual craftsman. The famine islands have an exclusive monopoly on woodcrafts dependent on greenheart because this hardwood grows well nowhere else in Fiji or Tonga. The making of canoes is particularly important because of the communal effort and series of feasts which mark each step in the process, and also because canoes provide the transportation which makes native inter-island trade possible. The woodcrafts are controlled by hereditary carpenters who have learned their skill from relatives in their hereditary carpenter clans. On Kambara, the main woodcraft island, there are two such carpenter clans (called Matai Lemaki and Matai Sau), each with its own history, traditions, and standards of craftsmanship. These clans are headed by able and intelligent men, Tatchini of Tanggu and Tandu of Undu. If these two master craftsmen would cooperate by urging more youths to learn the craft, by raising the standards of workmanship which have slumped in recent years, and by encouraging pride in individual creation, the woodcrafts on Kambara would be stimulated.

000 However, still more important to the economic life would be the increased production of barkcloth, mats, and perfumed oil, which are valuable articles of native trade made by the women. The quality of these articles from southern Lau, especially barkcloth, is still high, and they are in demand for every large ceremonial exchange honoring a high chief in Fiji. In recent years the women of Lau have had far less work than
